DevOps Engineer

LinkedIn || GitHub

PROFESSIONAL SUMMARY

DevOps Engineer (Junior) with hands-on experience in containerization, CI/CD pipelines, and Kubernetes-based deployments.
Skilled in building automated workflows using Jenkins, containerizing applications with Docker, and deploying scalable systems on Kubernetes clusters.
Experienced in implementing end-to-end DevOps pipelines including build, test, and deployment stages, along with reverse proxy configuration and service networking.
Currently advancing cloud expertise in AWS and strengthening DevOps practices through real-world projects and continuous learning (KodeKloud, Honhar Program).
Strong focus on automation, scalability, and bridging development with production-ready infrastructure.

TECHNICAL EXPERTISE

Operating Systems & Core:
- Linux (System operations, CLI, process & service management)

Containerization & Orchestration
• Docker (Dockerfiles, Docker Compose, Volumes, Networks, Multi-Stage Builds, Containerization)
• Kubernetes (Namespaces, Deployments, Services, ConfigMaps, Secrets, NodePort, ClusterIP)

Version Control
- Git (Branching, commits, collaboration workflows)

Web & Reverse Proxy
- Nginx (Reverse proxy configuration, request routing)

Cloud Platforms
- AWS (EC2, S3, IAM, basic cloud architecture, Security Groups, CloudFormation, CloudWatch)

CI/CD & Automation
- Jenkins
- GitHub Actions (Learning)
- CI/CD Pipelines

DevOps Practices
- Containerization & Deployment Strategies
- Service Networking & Communication
- Environment Standardization
- Basic Infrastructure Design

Monitoring & Observability
- Prometheus (Application and infrastructure metrics monitoring)
- Grafana (Real-time dashboards and performance visualization)

Learning & Certifications
- Kubernetes (CKA Track – KodeKloud)
- AWS DevOps Engineering (Honhar Program – In Progress)

PROFESSIONAL EXPERIENCE

DevOps Intern | CodeOps Pro May 2025 | Remote | Full-Time
Duration: 3 Months

- Worked on containerization of applications using Docker to ensure consistent environments across development and deployment
- Gained hands-on experience with Kubernetes fundamentals including deployments and service exposure
- Assisted in setting up multi-container environments and understanding service communication
- Practiced real-world DevOps workflows including build, deploy, and debugging cycles
- Strengthened understanding of DevOps lifecycle and infrastructure concepts

PROJECTS

Full-Stack Kubernetes Deployment (School Management System)

Tech Stack: Docker, Kubernetes, Nginx, React, Node.js

Key Contributions & Achievements

- Transformed an academic project (originally built by a friend) into a production-like DevOps deployment environment
- Containerized frontend and backend services using Docker for environment consistency
- Configured Nginx reverse proxy to manage routing and improve request handling
- Deployed the application on Kubernetes cluster with proper resource structuring

Kubernetes Implementation

- Created isolated namespace for application deployment
- Used ConfigMaps for environment configuration and Secrets for sensitive data
- Deployed services using Kubernetes Deployments
- Exposed services via NodePort and ClusterIP
- Enabled internal communication between frontend and backend services

Monitoring & Observability

- Implemented Prometheus and Grafana for monitoring application and infrastructure metrics

Outcome

- Successfully deployed and accessed a multi-tier application on Kubernetes
- Validated service-to-service communication inside cluster
- Bridged gap between theory and real-world DevOps practices

Next Improvements (Planned)

- Ingress Controller setup
- TLS/HTTPS implementation
- CI/CD pipeline integration
- Monitoring & logging stack

CI/CD Pipeline Automation
Technologies: Jenkins, Git, Docker, Docker Hub

- Designed and implemented Jenkins CI/CD pipelines for automated build workflows
- Integrated Git repositories with Jenkins for continuous integration
- Automated Docker image build process after source code changes
- Configured automated image publishing to Docker Hub
- Reduced manual build and image management tasks through pipeline automation
- Improved deployment readiness by maintaining versioned container images

Frontend Web Applications (React Projects)
Tech Stack: React.js

- Developed multiple frontend applications using React
- Built UI components and handled basic state management
- Deployed web applications for testing and experimentation
- Explored AI-assisted development workflows for rapid prototyping

EDUCATION

BS Computer Science
Kohat University of Science & Technology (KUST) | 2023 – 2027 (In Progress)
- Currently in 6th Semester

HONORS & LEARNING

- AWS DevOps Engineering Program – Honhar (In Progress)
- Kubernetes Learning Path – KodeKloud (CKA Track)
- Continuous self-learning in DevOps, Cloud, and Automation
